Networking

1. Can you tell me what exactly it's doing?

How would you like to rate?

Poor Average Good Excellent

Add Skill Evaluation

\*Candidate's Strength:  
Good understanding of System Design concepts, particularly rate limiting. Decent grasp of Python fundamentals and database transactions.

\*Improvement Points:  
Needs to solidify understanding of database sharding and partitioning, especially the distinction from replication. Should review Python's GIL in more detail and correct the misconception about its removal. Improve clarity and conciseness in explanations.

\*Overall Remark:  
Recommended

\*Overall Score:  
71

**Question Asked**  
Please Provide Asked Question

Networking

1. Can you tell me what exactly it's doing?

Ans. So, HTTP is basically a set of rules that is being used on the basic web interfaces. So, the use case of protocol is to transferring the text over the internet from one device to another device, that's the abbreviation talked about hypertext transfer protocol. That means in hexadecimal and rules how it will be transferred.

Summary:  
The candidate has a basic understanding of HTTP. They correctly identify it as a set of rules for web interfaces and its purpose for transferring text over the internet. The explanation is functional but lacks depth in terms of HTTP methods, status codes, or request/response structure.

System Design

1. Do you know what is a rate limit?

Ans. client is unreliable place to enforce basically a particular architecture that is in preventing multiple client accessing the same resource. is just limit but if a particular client repeatedly accessing a particular request too frequently then rate limiting a perfect way to prevent that why because the high server load you don't know how it is being done what are the algorithms used to rate limit.

How would you like to rate?

Poor Average Good Excellent
